People usually don't know the fact that Linux OS is a huge learning curve and is not for beginners. It is very important to go through a few essential articles and tutorials before starting. For Windows and macOS users, they have control over most of their computer and are used to perform every task without much help from computers and the Internet. On the other hand, for Linux users, it requires little effort to figure out a solution. If you are going to manage Linux server or desktop for the first time, here are some of the critical things you should keep in mind. Security vulnerabilities are the number one reason why the average computer user should reboot his or her operating system at least once a week. Well, if you're still using Windows, you may be scoffing at the notion. But we all know that it's true, and the next time you click the Start button, you will see Windows pop-up a series of security dialogs that force you to verify that you want to start the computer. As a Linux user, you should be more willing to have your system rebooted, even if it's just because a single software package has a bug. There are five reasons why Linux needs reboots. The first and most important reason is security. The third-party Linux operating system comes in two versions—the Unix and the desktop. The major differences between these versions are their operating system applications and features. Today we will be reviewing the differences between these two versions of Linux. Is there a machine in your business that doesn't need a server? We♦ f678ea9f9e
